Outstanding Lavender Hybrid for Winter Flowering

A bountiful producer, Lc. Tiastrian has flowers of heavy texture and lovely proportion. Overlapping sepals and petals, with petals measuring six to seven and a half inches in spread, are typical of the blooms. The broad lip is of very rich coloring, moderately ruffled, and has slight yellow veining in the throat.

Lc. Tiastrian has been a Rivermont favorite for several years, but mature plants have been unavailable in any quantity. A whole group of our seedlings have been grown to maturity and almost 150 plants are now available to prospective buyers.

As you can see from the accompanying photograph, the plants are in sheath and in exceptionally good to excellent cultural condition. They are available in five to eight inch pots from \$30.00 to \$45.00. We suggest you designate the price range and allow us to select the finest plant within that range for you.

For those with a mind to breeding background:

One parent is Lc. Asbury, Fine Variety, whose parents are C. Trianae and Lc. Ortega. Ortega is the product of C. Dowiana and Lc. Labiosa. Labiosa is out of C. Labiata and Lc. Luminosa. Luminosa comes from C. Dowiana and L. Tenebrosa.

The other parent is C. Titrianae, which comes from C. Trianae and C. Tityus. Tityus is sired by C. Enid (C. Mossiae x C. gigas) and C. Octave Doin (C. Dowiana x C. Mendelii).
